

# Capstone Project – Investment Portfolio optimizer

Rahul Krishnan

# Business Objective

- To help the average investor build a portfolio of stock and ensure maximum returns. Goals of the investor could range between short-term goals like saving for a dream vacation, down payment of a home etc. to long-term goals like saving for child's education, retirement etc.
- The assumption here is that the investor already has an idea of the companies he/she wants to invest in. The aim here is to provide the investor the tools to make the final decision whether to invest or not. There will be no recommendations or financial advice given to the investor.
- Focus will also be on diversification i.e. by investing in different sectors, investors can reduce their risk and get better returns rather than just betting on the next unicorn.

# EDA-'APPL'

## Stock Price of AAPL

## Stock Returns of AAPL

## EDA-'APPL'

Beta value = [0.50598994]

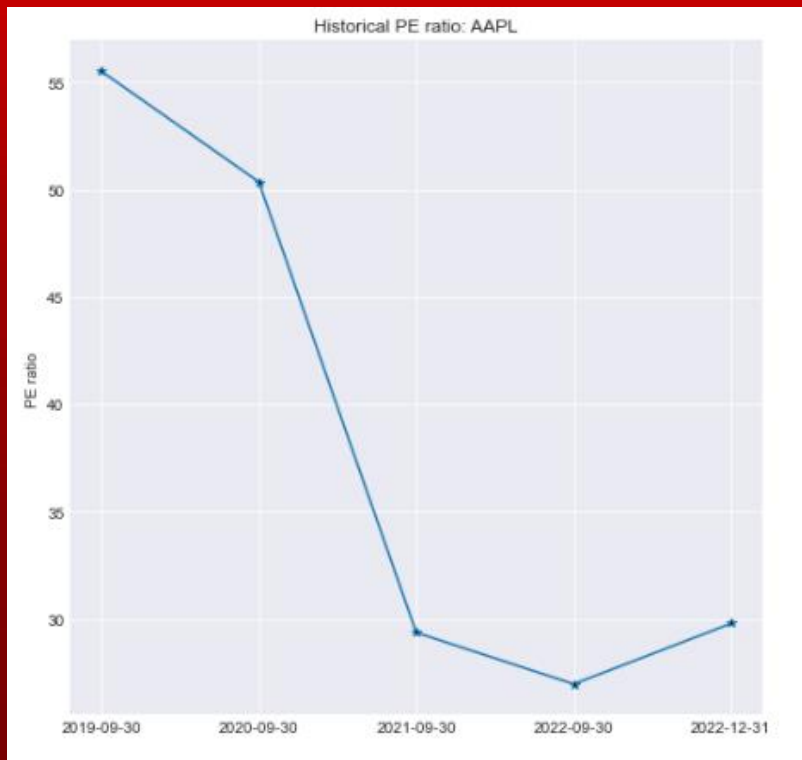

Beta Value: Used to classify risk of a particular stock.

If the beta value  $< 1.0$ , then the stock is considered to be less risky and vice-versa.

## EDA-'APPL'

P/E ratio: Used to determine if the stock is undervalued or overvalued

A high P/E ratio means that the investor is paying a premium for a share of the company's earnings, while a low P/E ratio means that an investor is betting on future growth of the company.

# EDA-'APPL'

Dividend: is a reward to the share holders for investing in the company

Dividends are an added bonus for the investor. By investing in companies with a history of paying dividends, an investor can bank on additional returns.

# Conclusions

## Limitations:

1. All the models are purely mathematical models and cannot take into account black swan events.
2. More sophisticated models using Deep Learning can be built to get more accurate forecasts.
3. Dividend data is not incorporated while calculating overall returns.
4. Currently, the invested amount is distributed equally amongst all the stocks. The amounts can be tuned based on the investor's appetite for risk.

## Recommendations:

1. By plugging in amounts and companies in the model, the investor can play around and maximize his/her returns.
2. Looking at the stock market in general, there was a drastic spike around 2020. There has not been a decline to pre-2020 levels and hence, it might be prudent to collect past data only from 2020 onwards rather than from all the way back to 2017.

Thank You!
